

ALEXIS COSTA

Full Stack Developer (Java / Spring Boot + React)

Buenos Aires, Argentina | alesideveloper@gmail.com | alexissdev.dev | github.com/alexissdev

SUMMARY

Full Stack Developer with 3+ years of hands-on experience building and shipping production software, with a strong focus on backend development in Java / Spring Boot and working knowledge of React on the frontend. Comfortable designing event-driven, microservice-based systems (Kafka, RabbitMQ, Redis) as well as delivering complete client-facing products end to end, from database and API design to a deployed, real-world application used by an actual business.

TECHNICAL SKILLS

- **Languages:** Java, TypeScript, JavaScript, SQL
- **Backend:** Spring Boot, REST APIs, JWT Authentication, Hibernate, Microservices, Google Guice (DI), Guava EventBus, Domain-Driven Design, Node.js (serverless functions)
- **Messaging & Data:** Apache Kafka, RabbitMQ, Redis (Lettuce, pub/sub, TTL caching), PostgreSQL, MySQL, MongoDB
- **Frontend:** React, Next.js, TypeScript, Tailwind CSS, WebSocket (STOMP), PWA, vanilla TS SPA (no frameworks)
- **Minecraft server development:** Spigot/Paper & BungeeCord APIs, Gradle multi-module builds, Vault economy integration
- **DevOps & Tools:** Docker, Docker Compose, Git/GitHub, Vercel, CI basics, Postman
- **Practices:** Clean Architecture, SOLID, OOP, MVC, service-oriented design, API documentation

EXPERIENCE

Full Stack Developer — Freelance 2021 – Present

Independent developer building full-stack applications for personal ventures and real clients.

- Designed, built and deployed a production PDF quote-generator web app for a construction company, used daily to create and share client quotes from mobile devices on-site.
- Implemented full account system from scratch: email/password auth with JWT in httpOnly cookies, email verification, password recovery, and per-endpoint rate limiting backed by MongoDB.
- Built a dual-mode data layer (local-only for anonymous users, MongoDB-backed for registered accounts) behind a shared repository interface, allowing the app to work fully offline as an installable PWA.
- Developed RESTful APIs with Java and Spring Boot, including JWT authentication/authorization and relational/NoSQL data modeling, dockerized for local development and deployment.
- Built responsive UIs with React, Next.js and Tailwind CSS, consuming REST and WebSocket APIs.

FEATURED PROJECTS

Relay — Real-time Chat Platform

Java, Spring Boot, Kafka, RabbitMQ, Redis, React, TypeScript, Docker

github.com/alexissdev/relay-backend | github.com/alexissdev/relay-frontend

- Slack-style chat application built as 7 independent microservices (auth, workspace, channel, messaging, notification, file, presence), each with its own data store, communicating asynchronously through Kafka events.
- Implemented an API Gateway (JWT validation, CORS, rate limiting) plus service discovery (Eureka) and centralized configuration (Config Server) so services can be developed and scaled independently.
- Built the companion React + TypeScript frontend with WebSocket (STOMP) for real-time messaging, packaged as an installable PWA for iOS and Android.
- Wrote per-service documentation (domain model, endpoints, events, configuration) plus a dedicated frontend-integration guide, structured as a docs/ directory for maintainability.

Quote Generator — Construction Company Tool

React 19, TypeScript, Vercel Serverless, MongoDB, jsPDF, PWA

github.com/alexissdev/quote-generator | presupuestos.braianconstruccion.com

- Live production tool that lets a contractor fill a short form and generate a branded, multi-page PDF quote, with one-tap sharing to WhatsApp via the Web Share API.

- Built a full account system (JWT auth, email verification, password recovery, rate limiting) on Vercel serverless functions with MongoDB/Mongoose, alongside a fully offline, account-free anonymous mode backed by localStorage.
- Applied SRP/Open-Closed principles: presentational React components, framework-agnostic domain logic shared between frontend and backend, and swappable repository implementations (local vs. API) selected at runtime.
- Shipped as an installable, offline-capable PWA so quotes can be generated on-site without an internet connection.

Annihilation — Multi-Server Minecraft Network

Java 11, BungeeCord, Redis, MongoDB, React, TypeScript

github.com/alexissdev/annihilation | annihilation.alexissdev.dev

- Built a multi-server team-PvP network (BungeeCord proxy + Lobby + N Game servers) as 4 independently deployable Java modules, decoupled entirely through Redis pub/sub events and MongoDB persistence.
- Implemented a distributed matchmaking pipeline: a scheduled processor dequeues players from a Redis queue every 5 seconds, selects the best available arena, and coordinates cross-server player transfers between BungeeCord and Game nodes.
- Designed a 6-phase match state machine (countdown, PvP phases, boss event, automatic world reset) with dynamic border shrinking, 21 selectable combat classes across 7 roles, and a cosmetics/shop system cached in Redis and synced to MongoDB.
- Built a companion documentation SPA (Annihilation Web) in React 19/TypeScript: 22 routes, global full-text search (Cmd+K), an interactive module dependency graph, and a full Java API reference for 40+ classes in 3 languages.

Kronos — Hardcore Factions Game Core

Java 11, Guice, Guava EventBus, MongoDB, Redis, Gradle

github.com/alexissdev/kronos | kronos.alexissdev.dev

- Designed a production Hardcore Factions (HCF) core with Domain-Driven Design architecture, split into 12 independently buildable Gradle modules (factions, claims, KOTH, economy, classes, timers, and more).
- Used Google Guice for dependency injection and a Guava EventBus for cross-module communication, so modules react to domain events (e.g. a faction's DTK changing) without depending directly on each other's services.
- Built a fully asynchronous I/O layer with CompletableFuture over MongoDB and Redis/Lettuce, keeping every database call off the main server thread, with a dedicated dispatcher to safely run Vault economy calls back on it.
- Built a companion documentation site (Kronos Web) as a dependency-free SPA in vanilla TypeScript + Vite + Tailwind: custom History API router, generated search index, dark/light mode, and EN/ES i18n.

EDUCATION

Self-taught Software Developer — continuous, project-driven learning in backend and full-stack development (Java/Spring Boot ecosystem, React, distributed systems).

LANGUAGES

Spanish: Native | English: Intermediate (technical reading/writing)
